Think Aloud

Talk through an unfinished idea in the language you're comfortable with.

Problem

When students and early project teams are working through a rough idea, writing a polished prompt can break their train of thought. A useful sounding board helps them question what they know and leave with a small test they can actually run.

Solution

Record or import a short voice note, review the transcript, then choose how one companion should respond: Explore, Challenge, Clarify, or Adaptive. The conversation keeps its context. A saved thinking board separates observations, assumptions and possible directions, and records one next experiment. Replies can be played aloud. Conversations and drafts stay in the browser and export to Markdown.

What changes in practice

In the illustrative Marathi example, a student thinks more publicity will increase club attendance. The companion questions that assumption. The student adds that a friend felt uncomfortable arriving alone, then proposes connecting five newcomers with an existing member. The next step changes around that choice. Saved Marathi and Hindi-English conversations let judges hear actual app responses without using programme credits.

Gnani technology and my contribution

Gnani Prisma v3 converts voice notes to editable text. Gnani Timbre v3 plays replies using the Shivani voice. Gemini supplies the reasoning. I designed and built the conversation flow, thinking board, language handling, browser history and export, and server-side usage limits, with AI coding assistance.

What I tested

The voice and reasoning integration was checked with synthetic inputs across ten languages, including a separate Hindi-English mixed example. Those tests establish that the parts work together in the tested cases. The board is a working record of the conversation, and its suggestions are hypotheses for the user to test.
